

Innovation Report

HTML, CSS, Javascript, and Github can all be used for innovation in Library and Information Services in a variety of ways. One notable way HTML, CSS, and Javascript can be used to innovate is through building websites—especially because, during the pandemic, libraries rely on their websites more than ever. By building more effective websites, libraries can keep patrons connected and able to access library material even if they can't physically come to the library.

Another way that libraries can innovate through HTML/CSS/Javascript is by offering coding courses to patrons, especially children. Though this doesn't directly change the function of a library, teaching coding can help fuel the innovation in libraries by building their reputation as centres of learning. Because the world is increasingly high-tech, it's important for libraries to continue to innovate by providing their communities with the resources and skills to succeed, and teaching coding could be a part of that.
